

>>>CONTAINMENT<<<

In 1950 Civil Defence was established to respond to the potential risks and hazards that might result from the deployment of a nuclear device. Their role was to contain the effects of such a catastrophe. Now much broader in its remit and less focused on effects of international disharmony, "Containment" remains relevant to Civil Defence.

The main elements of "Containment" are a bronze sphere (500mmØ) and a stainless steel form (3200mm high). The sphere is held in place – contained – by stainless steel cables.
